

Deployers

Deployer build runners enable TeamCity to upload artifacts to external locations in a number of ways.

The following build runners are available:

- [SMB Upload](#)
- [FTP Upload](#)
- [SSH Upload](#)
- [Container Deployer](#)
- [SSH Exec](#)

Deployer build runners are implemented as a plugin bundled since TeamCity 10.0. For earlier TeamCity versions use the [stand-alone plugin](#).
