

Managing Projects and Build Configurations

Projects and their entities in TeamCity can be configured:

- via the web UI
- using the [REST API](#)
- programmatically using DSL based on the Kotlin language if the [versioned settings](#) feature is enabled

Configuring Visibility

The Configure Visible Projects pop-up on the Projects Overview page allows managing projects display.

An individual project can be added to / removed from to the Projects Overview page using the "eye" button on the Project Home page:

Note that if a project has [archived subprojects](#) / [paused build configurations](#), they will also be displayed on the overview page and will be marked correspondingly.
