

# EAP 7269 Release Notes

## JDK 1.6

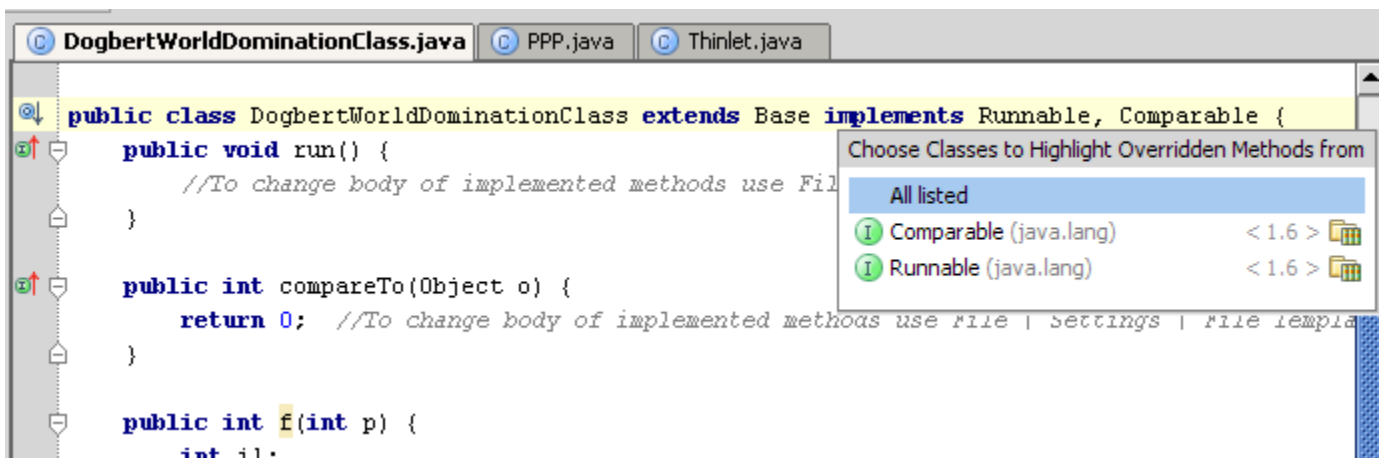

The Windows and Unix versions are now built with JDK 1.6, and the Windows version is bundled with JRE 1.6.0\_02. The Mac version is still built with JDK 1.5.

### Notice to Plugin Developers

If you want your plugins to be compatible with the Mac version of IDEA, you need to build your plugins with JDK 1.5. A separate ZIP archive is now provided that contains IDEA JARs built with JDK 1.5. You can build against JARs from that archive.

## Highlight methods overridden from selected class/interface.

Press highlight usages (Ctrl-Shift-F7) on extends or implements clause.

## Highlight Non-project classes in the stacktrace.

## Search bar enhancements

- Regular expression support
- Recent history (shortcut is either Ctrl(Meta)+Down Arrow or repetition of the shortcut you've selected search bar with, like Ctrl+F and Ctrl+F again).

- Camel case word completion in search field with Ctrl+Space.

## New license server

If someone in EAP happens to use license server you'll need to add `-Doldlicenseserver` to IDEA VM parameters. We're in process of replacing license server with completely different implementation.

## Inline Parameter refactoring

"Inline" can be used on parameters. If all method calls use the same parameter value, it is inlined into the method and the parameter is removed.
