

# MPS Documentation Page

## What is MPS?

The JetBrains Meta Programming System (MPS) is a [Language Workbench](#) or a programming environment which makes it easy to define your own specialized languages.

A [language](#) defined in MPS can only be used in the same workbench (or in a specifically tailored environment) together with other DSLs to develop solutions.

Any MPS language receives basic [IDE](#) support such as code completion and navigation, which can be further customized and enriched with specific refactorings, intentions, error highlighting and so on.

MPS language is [not textual](#), and its definition is not based on a grammar. A great advantage of this is that your language can be developed as a pretty isolated module and can then be mixed with other languages to create a blend which perfectly matches the problem domain.
