

Visual Studio Online Team Rooms Notifier

General Info

Author	Evgeniy Koshkin
License	Apache 2.0
Type	free, open-source

Plugin Description

Allows sending notifications from the TeamCity server to [Visual Studio Online](#) team rooms.

Plugin Development Status

Experimental. Stable.

Download

The latest successful build is available on [the public TeamCity server](#). Compatible with TeamCity 8.1.x+

Installation

1. Put `vso-rooms.zip` into the `<TeamCity Data Directory>/plugins` folder.
2. Restart the server.

The notifier is disabled after the plugin installation. You can enable it on the [Administration | VS Online Notifier](#) page.

Configuration

Users are required to [enable alternate credentials](#) in their Visual Studio Online account.

To send notification messages, a user account in Teamcity is required. A separate account for notifications is recommended. The following information needs to be provided on the [Notification Rules | VS Online notifier](#) page for the specified user account:

- the Visual Studio Online account
- the target Team Room
- the user's credentials to connect to the room (the alternate credentials specified in Visual Studio Online earlier).

 Notifications on a particular event sent by several users to the same room will be merged.

After testing and saving the connection settings, you can configure [notification rules](#) defining what to watch and when to send notifications.

When the rule is saved, TeamCity will send notifications to the configured Visual Studio Online Team Room as events happen.

See the related blog-post for [step-by-step instructions](#) .
