

CCMonitor

CCMonitor is a Cruise Control monitor and control panel. It indicates the build status (success or failure) and whether a build is currently running. You can pause the entire build queue, or force builds or pause individual projects.

To configure, enter the URL of your Cruise Control server's RSS feed and of the root of its JMX console. You can select how to sort the projects in the status display, and how often to refresh project status; turning it down to zero means you must manually refresh the status. The "Fast Build Refresh" option refreshes twice as often if a project is being built.

Written for IDEA 5.1; tested under 6.0.
