

EAP 6776 Release Notes

New Local History implementation

New and old Local History now work simultaneously. Therefore IDEA will consume a bit more memory than usual. You can access new LH dialog with Show History (New)... action.

Implemented features so far:

- tracking most file changes
- showing file and directory history and difference
- basic file rollback (rename, content change)
- refreshing on file types changes

Unimplemented:

- full file rollback (move, parent directory recovery)
- directory rollback
- user labels
- extended history table in Show History dialogs

Notes:

- history is now bounded by 5 days period.
- some problems may occur with file encodings

Background VCS Operations

The following VCS operations can now be performed in the background:

- Perforce add, remove, edit and integrate
- CVS add and remove

Also, Perforce changelist synchronization no longer blocks the UI thread.
