

Working with Strings in Scala

Redirection Notice

This page will redirect to <https://www.jetbrains.com/help/idea/working-with-strings-in-scala.html>.

IntelliJ IDEA lets you add different intentions for strings and perform different actions with strings in Scala. IntelliJ IDEA also supports the Scala multi-line strings feature. This feature lets you format literals and helps your code to look more orderly.

1. How to Insert Gap with Concatenation into a String

IntelliJ IDEA lets you insert a gap with concatenation intention. To do that, in your editor enter a string and press Alt+Enter. The list of appropriate intentions opens.

Select Insert gap with concatenation (" + ") and press Enter.

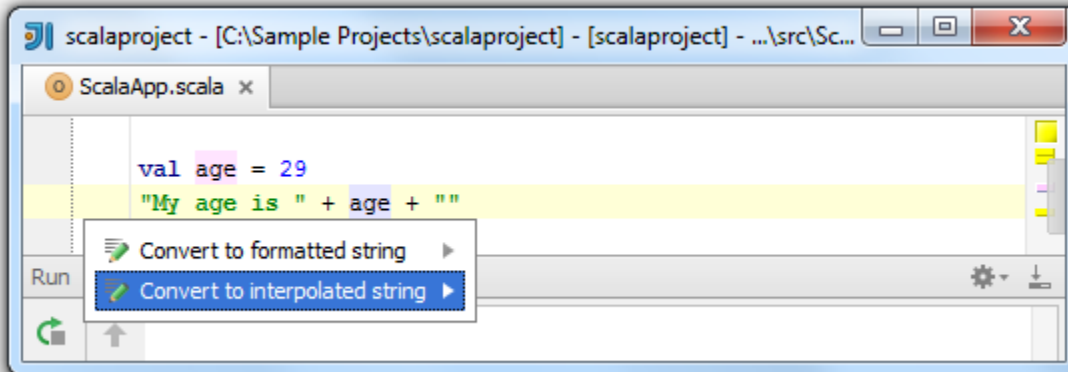

Now you can insert a value into your string. You can evaluate the result in the Scala Console window.

2. How to Convert a String Concatenation into Interpolated String

For the Scala version 2.10 and later you have the ability to convert a string concatenation into the interpolated string. To do that, select a value with concatenation in your string and press **Alt+Enter**. The list of appropriate intentions opens.

Select **Convert to interpolated string**, press **Enter** and view the result.

You can also choose an option Convert to formatted string and get your basic Java formatted string.

3. How to Convert a String into a Multi-line String and Vice Versa

You can convert your string into a multi-line string. Simply enter your string, pressAlt+Enterand select Convert to ""string"" option in the drop-down list of intentions.

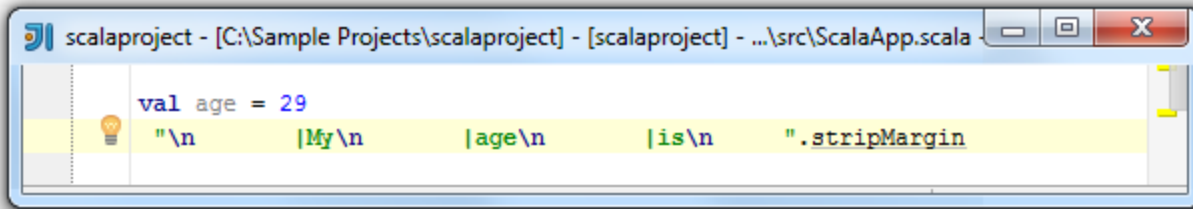

Converting to multi-line strings removes escaped sequences such as '\\ or '\n'.

You also can convert the multi-line string into the regular string.

PressAlt+Enter to open the drop-down list of intentions. Select Convert to "string" and pressEnter.

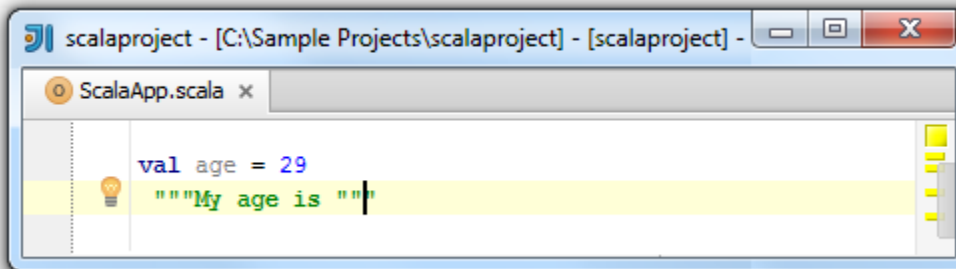

View the result.

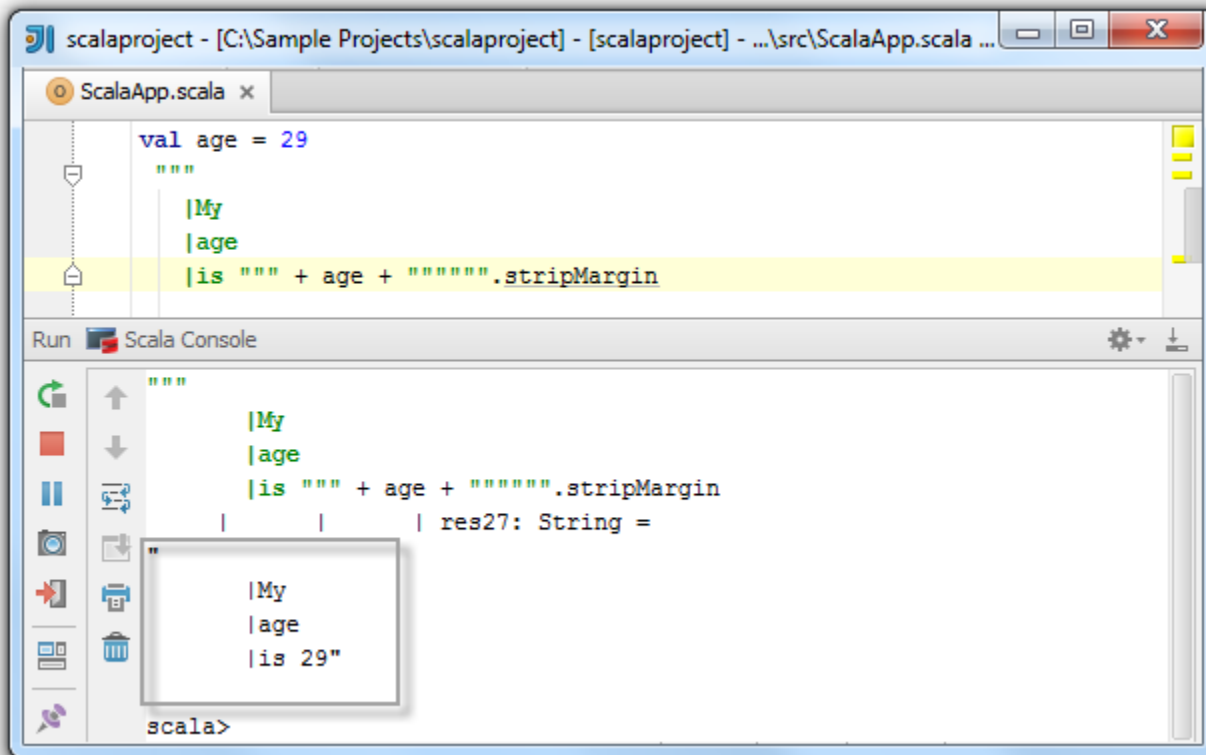

```
scalaproject - [C:\Sample Projects\scalaproject] - [scalaproject] - ...src\ScalaApp.scala  
val age = 29  
"""  
  |My  
  |age  
  |is  
  """  
  .stripMargin
```

To start entering a multi-line string, simply type triple quotes in your editor.

```
scalaproject - [C:\Sample Projects\scalaproject] - [scalaproject] - ...  
ScalaApp.scala x  
val age = 29  
"""My age is """
```

If you press `Enter`, it will automatically invoke `stripMargin` method. The `stripMargin` method removes the left-hand part of a multi-line string up to a specified delimiter.

```
scalaproject - [C:\Sample Projects\scalaproject] - [scalaproject] - ...src\ScalaApp.scala ...  
ScalaApp.scala x  
val age = 29  
"""  
  |My  
  |age  
  |is "" + age + """"  
  .stripMargin  
Run Scala Console  
""  
  |My  
  |age  
  |is "" + age + """"  
  .stripMargin  
  |      |      | res27: String =  
  |My  
  |age  
  |is 29"  
scala>
```

The white spaces are also preserved. Please see the following example:
